Portfolio | LinkedIn | GitHub

SUMMARY

Strategic and results-driven Software Engineer with expertise in backend and full-stack development, system architecture, and API design. Proven experience building and optimizing scalable, high-availability platforms across fintech, AI, marketplace, and Web3 domains. Adept at system planning, technical leadership, and cross-functional team collaboration to deliver business-driven solutions. Strong in open-source contributions and stakeholder communication.

EXPERIENCE

Co-founder&CTO — driinkwater *Jan 2025 – Current*

- driinkwater is a water delivery marketplace that connects customers with trusted water vendors.
- Designed and built the backend and database architecture, including role-based access control for admins, vendors, and customers
- Implemented platform security, including vendor KYC/KYB verification
- Integrated Paystack with split payments so vendors are paid automatically and the service fee is deducted per transaction
- Integrated AI to power customer support and other in-app assistance
- Built the web app with Next.js, Tailwind CSS, Node.js/Express, and PostgreSQL
- Led the product from build through launch

Tech Stack: *Next.js, TypeScript, Node.js, PostgreSQL, Openai, Cloudflare, Neon*

Lead Software Engineer, Full Stack (Contract) — Mgxresearch *May 2026 – Aug 2026*

- Led a 3-person engineering team to architect and build a production-grade fintech platform designed to scale to 10,000+ users, delivering a Go-based Banking-as-a-Service backend, a multi-tenant payment gateway, and three role-based Next.js applications (user, merchant, admin) from zero to production.
- Directed system design and build sequencing — data model, service boundaries, JWT-based auth, and RBAC across three user tiers — coordinating implementation across the team before development began.
- Reduced fraud exposure by architecting layered security checks — tiered KYC (NIN/BVN identity verification), HMAC webhook signature validation, and dedicated fraud-check, settlement, and card-vault-isolation microservices.
- Built core banking and merchant payment infrastructure — wallet creation, double-entry ledger, peer-to-peer transfers, card payments, bank transfers, refunds, payouts, and automated API key rotation — architected for consistency under concurrent writes.
- Kept wallet balances consistent under transaction load by engineering webhook ingestion and reconciliation across NIBSS and Interswitch/card-network rails, plus admin tooling for transaction monitoring and fee control.
- Shortened release turnaround by partnering directly with product and design to translate business requirements into technical specs and release plans.

Tech Stack: *Go, Next.js, TypeScript, PostgreSQL, Docker, Kafka, Redis, AWS, JWT, REST APIs*

Mid-Level Full Stack Engineer — Choppaddi *Oct 2025 – Nov 2026*

- Built and optimized a food delivery platform serving up to 5,000 active users, including vendors, by designing backend APIs and real-time data flows in Next.js and Node.js for ordering, authentication, menu, cart, and vendor management.
- Prevented broken code from reaching production by strengthening CI/CD pipeline checks to catch errors pre-deployment, improving release reliability across the team's regular deployment cycle.
- Improved consistency and accessibility across the platform for its full user base by building reusable UI components adopted throughout the ordering and vendor-management flows.
- Supported system architecture and planning sessions with product, design, and engineering stakeholders to scope and deliver business-critical features.

Tech Stack: *Next.js, React, TypeScript, Node.js, PostgreSQL, Redis*

Mid-Level Fullstack Software Engineer — Bibuain Unique *Mar 2025 – Nov 2025*

- Led system architecture and planning for an enterprise crypto trading platform designed to process 10,000–20,000 transactions per day in Bitcoin and USDT.
- Coordinated with a 10–15 person cross-functional Bibuain team — payers, team leads, customer support, operations manager, and CEO — to design secure authentication and compliance frameworks governing vendor onboarding and access.
- Enabled real-time trading by integrating Paxful, Noones, and Binance APIs for live price monitoring and automated trade assignment.
- Strengthened platform trust and reduced fraud risk by architecting secure authentication and compliance checks across the vendor onboarding pipeline.

Tech Stack: *Node.js, PostgreSQL, React, Next.js, AWS, CI/CD, Supabase, NeonDB*

EDUCATION

B.Sc, Computer Science — National Open University of Nigeria (NOUN), Nigeria
Jun 2018 – Nov 2026

Diploma, Blockchain Technology — Baze University, Nigeria
Feb 2024 – Feb 2025

SKILLS

API Design & Development • Software Architecture & System Design • Algorithm Design & Code Optimization • API Integration • Collaborative Problem-Solving • Agile & Scrum • Version Control • Technical Leadership

CERTIFICATIONS

IBM DevOps and Software Engineering — Coursera | Google IT Automation with Python — Coursera | Blockchain Development — Women in DeFi | Full Stack Web Development — Udemy

LANGUAGES

English (Proficient) • Yoruba (Proficient)
